## **I. Planout**

To construct an efficient and fully functional car, a well-thought-out plan is essential. This plan includes a comprehensive strategy, defining the car's goal, and concluding the optimal strategy to achieve it.

### **a) Strategy**

A detailed strategy outlines the necessary steps and considerations for building the car. This strategy will ensure all components work harmoniously, resulting in a smooth and efficient build process.

### **b) Set Car's Goal**

The car's goal is to achieve autonomous navigation using sensors and a motor control system. This goal will guide all design and construction decisions.

### **c) Conclude Optimal Strategy**

Determining the best strategy involves analyzing different approaches and selecting the one that meets the goals most effectively. This includes considerations for hardware, software, and overall design.

### **d) Game Rules**

Understanding the game rules is crucial to ensure the car complies with all requirements and performs optimally in the competition.

### **e) Read Game Rules**

Thoroughly reading and understanding the game rules will help in formulating a strategy that adheres to the competition's guidelines.

### **f) Form a Rule Summary**

A summarized version of the game rules provides a quick reference to ensure all aspects of the car's design and operation comply with the competition's standards.

### **g) Understand and Apply**

Applying the game rules effectively ensures the car's performance is within the acceptable limits and maximizes its chances of success.

### **h) Build and Hardware Selections**

Selecting the right hardware is fundamental to the car's performance. This section outlines the building materials, steering mechanism, drive system, computing unit, and layout.

### **i) Building Material**

Choosing durable and lightweight materials is essential for the car's structure. Mblock parts and prototype boards will be used for this purpose.

### **j) Steering Mechanism**

A reliable steering mechanism, including a black 180° servo, is crucial for precise control of the car's direction.

### **k) Drive System**

The drive system will consist of 2 yellow DC motors controlled by a BTS7960 motor driver, providing the necessary power and control.

### **l) Computing Unit and Layout**

An Arduino Nano will serve as the central computing unit, with all components connected to it according to a well-planned layout.

### **m) Software and Algorithms**

Software and algorithms will control the car's movement and sensor processing. The programming language, algorithm flow, and necessary libraries will be detailed.

### **n) Programming Language**

The car's software will be programmed in C++, utilizing the Arduino IDE for development.

### **o) Algorithm Flow**

The algorithm flow will include functions for steering, movement, and sensor data processing, ensuring smooth and efficient operation.

## **II. Hardware**

Selecting components that match the goals required is essential for the car's performance. This section details the specific components chosen for the build.

### **a) Select Components that Match the Goals Required**

Components will be selected based on their compatibility and ability to meet the project's requirements.

### **b) Arduino Nano**

The Arduino Nano will act as the main control unit, managing all inputs and outputs.

### **c) BTS7960 Motor Driver**

The BTS7960 motor driver will control the motors, ensuring precise and efficient movement.

### **d) 2 Yellow DC Motors**

Two yellow DC motors will provide the necessary propulsion for the car.

### **e) 4 Ultrasonic Sensors**

Four ultrasonic sensors will be used for obstacle detection and avoidance, enhancing the car's autonomous navigation capabilities.

### **f) Black 180° Servo**

A black 180° servo will be used for steering, providing accurate and responsive control.

### **g) Mblock Parts**

Mblock parts will be utilized for the car's structural framework, offering versatility and ease of assembly.

### **h) Prototype Board**

A prototype board will be used for organizing and connecting the electronic components.

### **i) Battery: Lithium Ion 3.7V (3 pcs)**

Three lithium-ion batteries will power the car, ensuring sufficient energy for all components.

### **j) CmU Pixy Cam 5**

The CmU Pixy Cam 5 will provide visual data for the car's navigation system.

## **III. Hardware Build**

The hardware build involves assembling all components, making sure they fit together seamlessly, and forming a sturdy and functional car.

### **a) Use Mblock Strips to Form Steering Mounts**

Mblock strips will be used to create mounts for the steering mechanism, ensuring stability and precision.

### **b) Form a Frame for the Components**

A robust frame will be constructed to hold all components securely in place.

### **c) Use Mblock Brackets for Mounting Sensors and Motors**

Mblock brackets will be employed to mount the sensors and motors, providing secure and adjustable fittings.

### **d) Apply Steering System**

The steering system will be installed and calibrated for accurate control.

### **e) Electrical Connections and Schematic**

A detailed schematic will be created for the electrical connections, ensuring all components are correctly wired.

## **f) Connect All Components to Respective Pins on Arduino Nano**

Each component will be connected to its designated pin on the Arduino Nano, following the schematic.

## **g) Set a Schematic for Wiring**

The schematic will serve as a blueprint for all wiring, ensuring clarity and precision.

## **h) Conclude Final Wiring Diagram**

The final wiring diagram will be completed, providing a clear and accurate representation of all connections.

## **i) Wiring Connections on Prototype Board**

Wiring connections will be organized on the prototype board for easy access and troubleshooting.

## **j) Cut Wires to Given Size**

Wires will be cut to the appropriate length, ensuring neat and efficient connections.

## **k) Layout All Pins on Perf Board**

All pins will be laid out on the perf board in an organized manner, facilitating easy connections and adjustments.

## **l) Solder All Connections and Pins**

All connections and pins will be soldered securely, ensuring reliable electrical connections.

## **m) Check for Fault Connections**

Each connection will be checked for faults, ensuring all components are correctly wired.

## **n) Test with Sensors**

The sensors will be tested to verify their accuracy and functionality.

## **o) Debug and Test Components**

All components will be thoroughly tested and debugged to ensure they function correctly.

## **p) Test Perf Board with All Components**

The perf board will be tested with all components connected, verifying overall functionality.

## **q) Test Ultrasonic Sensor Accuracy**

The accuracy of the ultrasonic sensors will be tested, ensuring reliable obstacle detection.

### **r) Test Motor Driver Functionality**

The motor driver will be tested to ensure it can control the motors effectively.

## **IV. Gather All Parts and Construct Final Car**

All parts will be gathered, and the final car will be constructed, integrating all components seamlessly.

### **a) Assemble Perf, Frame, Motors, and Driver**

The perf board, frame, motors, and driver will be assembled into a cohesive unit.

### **b) Mount Sensors and Calibrate Servo for Steering**

Sensors will be mounted, and the servo will be calibrated for optimal steering angles.

### **c) Find Optimal Steering Angles**

Optimal steering angles will be determined to ensure precise control.

### **d) Test Fully Built Car**

The fully built car will be tested to ensure all functionalities work as intended.

### **e) Test Fully Built Car with Its Functionalities**

All functionalities of the fully built car will be tested, including movement, steering, and sensor data processing.

## **V. Test Software and Hardware Together**

The software and hardware will be tested together to ensure seamless integration.

### **A. Find Turning Angles and Delays**

Optimal turning angles and delays will be determined to enhance performance.

## **VI. Software**

The software development process involves setting up the environment, writing code, and ensuring the software interacts correctly with the hardware.

### **a) Environment and Setup**

The software development environment will be set up, using the Arduino IDE and C++ programming language.

### **b) Arduino IDE**

The Arduino IDE will be used for writing, compiling, and uploading code to the Arduino Nano.

### **c) C++ Coding Language**

The car's software will be written in C++, utilizing its powerful features and libraries.

### **d) C++ Servo Library**

The C++ Servo library will be used to control the servo motor, providing precise steering control.

## **VII. Code Basis**

The code will be structured to include functions for steering, movement, and sensor data processing.

### **a) Assign Functions for**

Functions will be assigned for specific actions such as 90° turns, right and left adjustments, and forward movement.

### **b) 90° Turn to the Right**

A function will be written to execute a 90° turn to the right.

### **c) 90° Turn to the Left**

A function will be written to execute a 90° turn to the left.

### **d) Right Adjust**

A function will be written to make slight adjustments to the right.

### **e) Left Adjust**

A function will be written to make slight adjustments to the left.

## **f) Forward**

A function will be written to move the car forward.

## **g) Sensor Values**

Functions will be written to process and utilize sensor values.

## **h) Ultrasonic\_Calculate**

A function will be written to calculate distances using ultrasonic sensors.

## **i) Set Up**

The setup process will involve declaring pins, aligning servos, and initializing sensors.

## **j) Declare**

Pins for the ultrasonic sensors and servos will be declared in the code.

## **k) Ultrasonic Pins**

The ultrasonic sensor pins will be defined and initialized.

## **l) Servo Pins**

The servo pins will be defined and initialized.

# **VIII. Setup**

The setup function will configure all pins and components for operation.

## **a) Ultrasonic Pins**

The ultrasonic sensor pins will be set up for accurate distance measurements.

## **b) Servo Alignment**

## **c) Get Values**

Functions will be written to retrieve values from the sensors.

## **d) Loop**

The main loop will check for various cases and execute corresponding actions.

## **IX. Check for Any Cases**

The code will check for different scenarios and respond appropriately.

### **a) Place Whatever You Think Is Good Right Here**

Additional necessary steps or functions will be added as needed.

### **b) Testing**

Thorough testing will ensure all components and code function correctly.

### **c) Check Connections**

All electrical connections will be checked for accuracy and reliability.

### **d) Check Ultrasonic Accuracy**

The accuracy of the ultrasonic sensors will be verified.

### **e) Check Code Functionality**

The functionality of the code will be tested to ensure it performs as expected.

### **f) Check for Missing Cases and Conditions**

The code will be reviewed to identify and address any missing cases or conditions.

### **g) Find Faults and Code Issues & Bugs (Skill Issues)**

Any faults or issues in the code will be identified and fixed.

### **h) Test Delays and Angles**

Delays and angles will be tested to ensure smooth operation.

### **i) Test for Forward Alignment**

The car's forward alignment will be tested and adjusted as needed.

### **j) Fix Steering Issues**

Any issues with the steering system will be identified and fixed.

### **k) Fix Code Logic**

The code logic will be reviewed and refined for optimal performance.

### **l) Try New Algorithm and Sequence**

New algorithms and sequences will be tested to find the most effective solution.

### **m) Write Summary/Report**

A detailed summary and report will be written, documenting the entire process.

## **n) Organize a Full Word Document**

A comprehensive Word document will be created, detailing all major steps and findings.

## **o) Write Down All Major and Main Steps**

All major and main steps will be documented in the report.

## **p) Form Final Report by Editing and Printing**

The final report will be edited for clarity and accuracy before printing.

## **q) Camera Testing**

The camera system will be tested to ensure it provides accurate visual data.

## **r) Before Competition Day Prep**

Final preparations will be made to ensure the car is ready for the competition.
